Sona golden paths

Manual test checklist for the iPhone UI, updated for the demo flow: ranked day, section sources, Next-step bar, medicine thumbnails, camera scan and shift handover (25 September 2026).

iPhone Release build · ai.zhiyuantech.sona | Simulator · Expo Go | Session-only data

Start: open Sona (force-quit first for a fresh session). Home shows "Here's what needs you first." and **Your day, ranked**. Paths 3–5 and 7–12 run inside a visit session opened in path 2. Every answer opens with **Takeaways** (up to three lines marked !, + or i); each section has a tinted icon header and, on its right, one **N sources** pill instead of inline links. Key terms are tinted (blue symptom, violet medicine, amber caution, teal finding). Demo-only controls (scenario picker, "Load synthetic eligibility", failure simulations) are hidden until you turn on Settings › Show demo controls in answers.

1 Your day, ranked

Home · first thing on launch

- [ ] 1. Open Sona.
  Expect "Here's what needs you first." A time bar (08:00–13:00) with visit blocks and a red now line; a **Most urgent** card: **Low potassium · Daniel Rahman**, "Low result · 2 h · no action yet". Below, one list: late or upcoming visits, "Confirm Amelia's medicines · 2 unconfirmed · blocks prescribing", open tasks. Every row states its reason.
- [ ] 2. Tap **Re-rank**.
  Expect A dark "Sorting your day…" pill pulses, then the items drop in one after another, most urgent first.
- [ ] 3. Tap ⋯ on a row, then **Snooze 1 h**; tap **Snoozed · 1**, then Wake.
  Expect The row leaves the list and collects under Snoozed; Wake returns it. Pin to top moves a row above the rest.
- [ ] 4. Tap the **Confirm Amelia's medicines** row.
  Expect Amelia's session opens straight into the medication answer with its Next-step bar (path 9).
- [ ] 5. Tap the Most urgent card.
  Expect Daniel's session opens with his briefing.

2 Home and visit sessions

Home · session screen · patient switcher

- [ ] 1. In Your day, ranked, tap the **09:30 · Amelia Tan** row.
  Expect Her session slides in: back arrow top-left, Amelia chip and tasks button top-right, her greeting and suggestions.
- [ ] 2. Tap **What should I know before I see Amelia?**
  Expect The lead streams in; then a tinted block springs across "respiratory", "review", "Cough" and "fever", each turning into a rounded chip. Below: three Takeaways.
- [ ] 3. Look under the Takeaways, then swipe the card left.
  Expect A progress bar labelled Vitals · Timeline · History · Next. The Vitals page shows oxygen, temperature ("Raised"), heart rate and allergy with small traces that draw in; swiping snaps to Timeline and the bar fills.
- [ ] 4. Swipe to **Next** and tap **Explore clinical questions**.
  Expect A reasoning answer appears (path 7).
- [ ] 5. Swipe from the left edge (or tap the back arrow).
  Expect Home, with no answers; Amelia's visit row now reads "In progress" and has moved down the ranking.
- [ ] 6. Tap Amelia’s row again.
  Expect The session opens at the latest answer, not the top.
- [ ] 7. Tap the **Amelia** chip (or **All patients** on Home).
  Expect One compact row per patient: avatar, name, a status dot and reason, time.
- [ ] 8. Tap **Daniel Rahman**.
  Expect A patient sheet slides up and its sections rise in: name, time and "Starts in …"; **Needs attention** chips (Low potassium, History incomplete, Allergies unknown); reason and observations; **Open visit** plus Brief me, Consultation, Medicines, Hand over. Drag it down to dismiss.
- [ ] 9. Tap the **Low potassium** chip.
  Expect Daniel's session replaces Amelia's and opens on his briefing; back goes straight to Home.

3 Voice orb

Inside a session · bottom centre

- [ ] 1. Press and hold the orb.
  Expect An aurora glass wave rises, words appear as if heard, and the orb shows listening bars.
- [ ] 2. Release.
  Expect The wave floods up and sinks away, the question sends, and the orb's icon changes (searching, reading) while the answer loads.
- [ ] 3. Tap the orb once, then tap it again.
  Expect Hands-free listening starts; the second tap sends.

4 Chatbox

Keyboard button · bottom-right

- [ ] 1. Tap the keyboard button.
  Expect The bar grows into a glass card in step with the keyboard, with a dotted shimmer while it grows.
- [ ] 2. Type **What possibilities should I consider?**
  Expect The send button turns dark with blue dots.
- [ ] 3. Send it, or tap outside the card.
  Expect The card shrinks back into the bar.

5 Attachments menu and camera scan

+ button · bottom-left · Photos, Camera scan, Files

- [ ] 1. Tap **+**.
  Expect The screen frosts; the + grows into a glass menu; Photos, Camera and Files arrive one after another.
- [ ] 2. Tap **Photos**, then the teaching X-ray (first tile).
  Expect The menu expands into a photo grid; picking the X-ray adds an X-ray answer to the conversation.
- [ ] 3. Open the menu again and tap **Camera** (allow access), then the shutter.
  Expect The frozen photo gets a blue halftone band sweeping bottom to top, the edges dim around a cornered frame, and a sheet springs up: **What is this image?** with Chest X-ray preselected, Skin, Wound, Document, Other. (Simulator: the teaching X-ray stands in for the camera.)
- [ ] 4. Pick a type and tap **Attach as …** (or **Retake**).
  Expect The menu returns with the photo as a thumbnail, named for its type. Nothing is read from the image yet: analysis says so.
- [ ] 5. Tap outside the menu.
  Expect It shrinks back into the +, with Files leaving first.

6 Sidebar

Home only · ≡ button

- [ ] 1. Tap **≡**.
  Expect The page slides right and shows Home, Patients, Consultation, Notes, Follow-up tasks, **Shift handover** (path 13) and History.
- [ ] 2. Tap Amelia under History.
  Expect Her session opens.
- [ ] 3. Open the sidebar again and drag the page back to the left.
  Expect It closes with a spring.

7 Clinical reasoning

Ask "What possibilities should I consider?"

- [ ] 1. In Amelia's session, tap the keyboard button, type **What possibilities should I consider?** and send (or, after any answer, tap it under "You might want to ask").
  Expect Takeaways (two unranked possibilities, exam and imaging still needed, asthma control). A frosted tab bar pins under the top bar: **Possibilities · History · Next**.
- [ ] 2. Tap the **Next** tab, then the **Possibilities** tab.
  Expect The page glides to each section and the dark highlight slides to the tab; scrolling by hand moves it too.
- [ ] 3. Tap **Pneumonia considered**.
  Expect Opens in place: Recorded context, Supports, Conflicts, Still needed. No inline links: the section header shows **4 sources**.
- [ ] 4. Tap the **4 sources** pill.
  Expect A short sheet rises, grouped under From the record and Published references. Tap a row: the sheet closes and the source detail opens.
- [ ] 5. Tap the quiet **Update history ›** row, fill in the fact and source, then tap **Save & update**.
  Expect The answer refreshes with the updated history.
- [ ] 6. Ask the same question in Daniel's session.
  Expect A "What to collect first" checklist instead of possibilities, with "Capture the missing history" as the action.

8 X-ray review and simulated analysis

Tap "Review Amelia's chest X-ray" · one page: image, then its analysis

- [ ] 1. Open the answer, then tap the image.
  Expect The answer shows the image, one attribution line and "In the uploader's words". Tapping the image opens the X-ray page: image as hero, zoom readout 1.0×, and an **Analysis** section directly below (no separate details page).
- [ ] 2. Pinch to zoom and drag.
  Expect Live zoom up to 5×, a stretchy stop at the edges, and a **Reset view** button.
- [ ] 3. Double-tap, then double-tap again.
  Expect Jumps to 2.5×, then fits back.
- [ ] 4. Tap the ⋯ at the top right of the header (level with the back button), then tap it again.
  Expect A small glass menu springs open with Choose local image and Remove image, then closes.
- [ ] 5. In Amelia's session, tap the keyboard button, then the **image icon** in the chatbox (this opens the current X-ray page, which has the analyse button; the page opened from an answer is the saved view). Scroll to **Simulated review** and tap **Analyse X-ray · simulation**.
  Expect You return to Amelia's session (not Home) and a new X-ray answer streams in with a halftone sweep beside the image, then "In the uploader's words" and one limits line.
- [ ] 6. Tap the image in that new answer.
  Expect The saved view: the image with its Analysis below it, on the same page.
- [ ] 7. Optional: Settings › **Show demo controls in answers**, then back on the X-ray page choose a demo response (unsupported / no finding) before analysing.
  Expect The answer and Analysis show that scenario's wording instead.

9 Medication review and prescribing

Tap "Check Amelia's medicines for interactions" · or the "Confirm Amelia's medicines" row in Your day

- [ ] 1. Open the answer.
  Expect Takeaways (medicines unconfirmed, allergy to confirm, no interaction database) and pinned tabs **Medicines · Interactions · Prescribing**. Below: "Confirm what's being taken", 0 of 2, then one allergy line, one interactions line ("… pairs without a conclusion"), and the feature card with one dark button.
- [ ] 2. Tap the **Prescribing** tab, then **Medicines**.
  Expect The page glides between sections; the highlight follows.
- [ ] 3. Look at the medicine rows and the bottom of the screen.
  Expect Each unconfirmed medicine shows a dashed outline of its form (inhaler, tablet); paracetamol shows as a white caplet. A glass **Next step · 1/5** bar sits above the dock with **Confirm**.
- [ ] 4. Tap the Next step bar (or swipe it up).
  Expect It sinks away and a **Before prescribing** sheet rises: confirm each medicine, run review, record eligibility, run simulation, each with its own button.
- [ ] 5. Tap **Confirm** in the bar and save the form. Do the same for the second medicine.
  Expect Confirm opens that medicine's form in place. On save the outline turns away and the drawn medicine springs in with a blue check (salbutamol becomes a blue inhaler); the bar's label slides to the next step. Count reads 2 of 2.
- [ ] 6. Tap the interactions line, then tap **Run review** (or **Review again**) in the feature card.
  Expect The pairs open in place; the review is marked current for this visit.
- [ ] 7. Follow the bar to **Run** the prescribing simulation.
  Expect Checks pulse one by one, then resolve. Without eligibility it is **blocked** (e.g. 5 of 11) and the bar points to **Record eligibility**, which opens the inputs. With every check met, the **Immutable receipt** seal lands with a haptic and the bar offers View.

10 Scribe (consultation recording)

Tap "Start consultation" in a session · one-line disclaimer, minimize is the ⌄ icon top-left

- [ ] 1. Tap **Start sample**, then **Allow in simulation · play sample**.
  Expect Blue waveform bars scroll, the timer runs to 00:12, and turns appear with a muted live line.
- [ ] 2. Tap a finished turn.
  Expect The correction form opens in place, with Clinician and Patient chips.
- [ ] 3. Wait for the end.
  Expect "Transcript ready", a frozen grey waveform, and **Create draft note**. The ⌄ icon returns to the encounter.

11 Consultation note

Tap "Create draft note"

- [ ] 1. Open the note.
  Expect Patient name, a Draft pill with one warning line, four sections with a small ⓘ each (tap one to see its provenance and source), and a floating glass bar at the bottom.
- [ ] 2. Type in Clinician assessment, then tap **Save draft** in the floating bar.
  Expect The bar's status line changes to saved.
- [ ] 3. Tap **Mark reviewed** in the bar.
  Expect The pill changes to Reviewed.

12 Follow-up answer and tasks

Tap "Prepare a follow-up plan" · tasks button top-right

- [ ] 1. Open the answer, then tap **Make it a task**.
  Expect "A clear next step" with Owner and Due chips and one quiet origin line; the tasks screen opens with just the patient name as header.
- [ ] 2. Type **Bloods @nur** and pick **Clinic nurse**.
  Expect "@nur" leaves the sentence and the Owner chip pops in.
- [ ] 3. Add **in 2 weeks** to the end, then tap **Due …**.
  Expect The Due chip fills and the + turns dark.
- [ ] 4. Tap **+**, then tap the new row.
  Expect The task appears under Open; tapping ticks it, strikes the title and moves it to Completed. Swipe right to reopen.
- [ ] 5. Tap the **Due** chip and flick the ruler; tap a week label; use the date pill.
  Expect A haptic per day; labels jump to weeks or years; the date pill reaches any future year.
- [ ] 6. Tap the chosen owner again.
  Expect The owner clears.
- [ ] 7. Go back to Home and tap the tasks button.
  Expect Follow-ups across all visits, "Add a follow-up for", and one line at the bottom: "Local simulation · nothing is booked or sent".

13 Shift handover

Home › "Hand over shift" · or sidebar › Shift handover

- [ ] 1. Open the handover.
  Expect "5 of 5 left" and a card stack. Each card is SBAR: S, B, A lines and R open items drawn from the visit (e.g. "Act on low potassium", "Confirm 2 reported medicines", "Review and sign the consultation note"), a Watch or Stable chip and a sources pill. Watch patients first; ward patients are marked "synthetic ward".
- [ ] 2. Drag the top card right slowly, then let go past the middle.
  Expect It tilts and tints teal (**Handed over**), flies off, the next card scales up; the counter reads 4 of 5 and **Undo** appears.
- [ ] 3. Drag one card left, or tap **Discuss**.
  Expect Amber **Discuss verbally**. Tap Undo to bring a card back.
- [ ] 4. Finish the stack with **Hand over**.
  Expect A summary: "N handed over · N to discuss", the names to talk through, and an editable **Receiving clinician**.
- [ ] 5. Press and hold **Hold to accept handover** (let go early once).
  Expect Releasing early springs the fill back. Holding 1.5 s fills it teal and a **Handover acknowledged** receipt names who accepted how many patients and when.
